

System upgrades show **VITROSEP** fine-tuning to remote checking

Against a backdrop of VITROSEP innovations, all on display at Vitrum this year, General Manager Josep Sais spoke to the editorial team of Glass Technology International about the company's tireless commitment to its new -and historic- customers.

GTI: Josep, what can you report on year-on-year performance at Vitrosep over 2022 and 2023?

José Sais: For us, 2022 signalled a year of complete post COVID recovery. Indeed if you look at our performance figures for 2022 you'll see that we reached the same performance levels we had prior to the pandemic - even with some improvement. As for 2023, so far it's keeping those indices buoyant and we're also seeing growth recov-

ery as we're already exceeding those values.

GTI: Any innovations on display here today?

JS: The system we're showcasing at Vitrum now is similar to the one we exhibited at Glasstec in Düsseldorf last year. It's one of our bestsellers, is very versatile, and it can be installed in small companies as well as those of medium to large dimensions. We also have here VITROBOX, our remote supervision solution, and VITRODOSE by

which we can upgrade systems installed twenty years ago to the latest patented Vitrosep technology.

GTI: Looking ahead, where

do you see your technologies going from here?

JS: In our specific sector, where water features significantly, we're especially focused on sustainability -

which includes driving solutions that can support a green and circular economy. Right now, water treatment is a very promising business. That also means we need to

be alert to current concerns around climate change and water scarcity. Here the new regulations make us very optimistic about the future needs of our customers, who're always more focused on arriving at more ambitious standards of quality and sustainability. For these hot-button issues they know they'll find a willing and ready ally in Vitrosep.
