

CMS Aura for automatically seaming rectangular glass

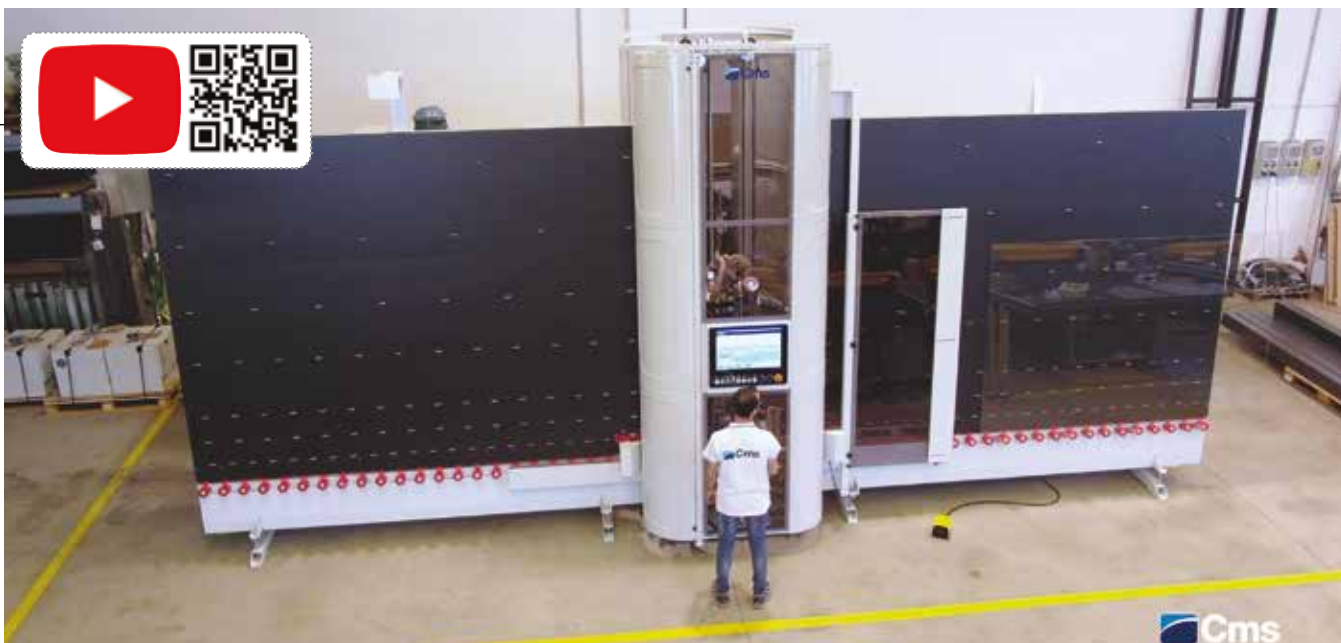

CMS Aura is a dry, vertical seaming machine - specifically designed by CMS Glass Technology to process edges without using water (dry seaming). Usable either stand-alone or in line with a vertical washing machine, it comes as ideal for inclusion on a double-glazing line.

Aura can seam float glass that's either laminated or has low-E treatment and is designed to meet the needs of those customers who are after practicality of use, rapid installation, reliability, and low running plant costs.

WORRY FREE

The operator loads the glass and starts the processing cycle;

the machine automatically measures the incoming glass (height, length, and thickness) and processes the edge. Not only. CMS Aura will also adapt its operator units to different thicknesses.

COST SAVINGS

CMS Aura allows for saving on production costs thanks to its dry seaming feature - which uses no water. Indeed, the tools have been specifically designed for dry use. The dust generated by the glass is sucked

up through a pipe system, which then conveys it to the back of the machine within a multi-stage filter.

ADVANTAGES

- No need for water (cost savings)
- Maximum operating speed at 25 m/min (enhanced productivity)
- Suited for 3-shift production (enhanced productivity)
- 100 percent automatic management of different thicknesses (enhanced productivity)
- All processing dust collected (safe processing)

ABOUT CMS GLASS TECHNOLOGY

Part of the SCM Group, CMS Glass Technology is an industry leader in the field of curved and flat glass operations, offering such technologically advanced solutions as numerically controlled machining centres, cutting tables and water-jet cutting systems. Thanks to its rich tradition and experience, the company is now a market leader in the manufacture of innovative solutions dedicated to architecture and interior decoration. The company operates successfully within many sectors, ranging from aerospace to automotive to the marine industry. It also offers widespread service for spare parts supply and after-sales assistance, with solutions that include the direct intervention of its technicians -all over the world- as well as remote support that uses sophisticated digital tools. The CMS Connect platform is able to offer customized digital services to support daily operations, maintenance and troubleshooting whilst improving both the availability and use of machinery and systems.
