COMPANY PROFILE

There is a **family history** that spans over 60 years and continues to write important pages in the history of glass tempering, and it is the story of **Mazzaroppi Engineering**. Founded in **Italy** just outside **Rome** in **1958**, this company is now run by the **third generation** and is a well-known global player thanks to its technologies and operational approach. This is thanks to Mazzaroppi's **philosophy** of ensuring **high performance, low consumption and maximum ease of use for those who choose its tempering systems**.

Mazzaroppi furnaces guarantee **up to 70% lower energy consumption than competing products**, while offering the highest level of performance. This is thanks to continuous innovation and technological optimisation of the systems over time, which reduces the energy requirements of hardening and guarantees a life **cycle of over 30 years** for each furnace. Those who choose Mazzaroppi today are investing in the future, equipping themselves with a long-lasting furnace and taking an important step towards sustainable working practices.

MAZZAROPPI MAKES GLASS TEMPERING SIMPLE!

Mazzaroppi creations are used all over the world and are a prime example of the value of **Italian manufacturing** in the glass sector. They also demonstrate an Italian approach to **problem solving**, with **user-friendly** management software and controls. With **clear and simple controls**, just like those on a smartphone, tempering glass of **different thicknesses and types** while always guaranteeing a high-quality result is easy.

People are also of the utmost importance: Mazzaroppi provides **on-site support** throughout the installation, testing and start-up phases of each system and offers

Every Mazzaroppi furnace is designed to make this process **accessible to companies and glassworks of all sizes**, simplifying operations for those who choose it.

Over the years, the company has increasingly focused on innovations that have a real and measurable impact on the daily lives of its customers.

This approach has led to solutions such as the **M Start&Stop - JIT Ignition function**, which brings the furnace **up to 680°C in just 30 minutes** following initial start-up and allows it to be switched off completely each day, **eliminating unproductive costs**. Another example is the **M Opticonvection** technology, which uses hot air only in the portion of the oven where the glass is located, adapting to the percentage of space occupied.

The latest innovation is the **patented M Efficiency 5.0 software**, which **optimises furnace consumption** at every stage of the tempering cycle. This allows the **peak power to be selected according to production type**.

This ensures even smarter, more uniform heating of the sheets, greatly improving the quality of the tempering process.

constant, comprehensive **assistance remotely and on site**. Mazzaroppi's '**easy tempering**' approach is based on maximum flexibility. Rather than the customer having to adapt to the oven, the Mazzaroppi oven is designed and programmed to work best in its intended environment.
